

# 21st Century Toolkit For IT Graduates

T.J.Kane, Purdue University Indianapolis

## Hiring in the Age of AI – Audience Scenario

Let's divide up into groups here and do an offline exercise!

You are the hiring group for a software development team at a mid-sized tech company. You're hiring a new graduate for a full-time developer role. AI is increasingly integrated into your workflows, and your team also builds and maintains custom software for clients across industries.

### Part 1: What Skills Do You Need?

**Instructions:** List the top 6–8 skills you're looking for in a candidate. Include both AI-related and general skills.

Skill	Why This Skill Matters

Notes:

## Part 2: Interview Questions

**Instructions:** For each skill above, write 1–2 interview questions that would help you assess whether a candidate possesses it.

Skill	Investigative Interview Questions

Notes:

## Part 3: The Tie-Breaker

**Scenario:** You've interviewed two candidates. Both are technically strong, have solid AI literacy, and good cultural fit. You can only hire one.

**Prompt:**

*What would place one candidate ahead of the other? Why?*

## Now Let's Debrief!

- Which skills were most commonly selected across groups?
- Are these skills being taught or assessed in your current curriculum?
- How would you **integrate** these skills into your course?
- What changes could help better prepare students for a successful career, given what employers are looking for?
